Escalating Redis team for RCA: [incident-747410355 Details - iCM](#)
51 redis... no redis maintenance event log in RT log...

Redis Reply:

RCA:

We have investigated the reported timeframe on 02/12/2026 at approximately 01:00 UTC and identified that a **maintenance event** was in progress during this period. This maintenance activity was necessary to ensure the continued performance, reliability, and security of our services.

During the maintenance window, some customers may have experienced intermittent connectivity issues or command timeouts. These effects were temporary and expected as part of the maintenance process.

Additionally, we suggest following the best practices below to help reduce the impact of transient connectivity events and enhance overall application stability during these periods. we strongly encourage applying them as outlined in the following documentation: [Best practices for connection resilience - Azure Cache for Redis | Microsoft Learn](#)

Recommendations:

To minimize maintenance impacts, we recommend setting up **scheduled patch windows** aligned with your maintenance strategy.
